Reporting Insights :

The Inventory Overview Report provides a centralized and interactive view of inventory performance across all warehouses. The report enables users to monitor key business metrics such as inventory value, item status, warehouse performance, category distribution, supplier contribution, and inventory health from a single dashboard.

The report is fully interactive, allowing users to select any warehouse, product category, supplier, item status, or stock status. Once a selection is made, all related visuals are automatically filtered, providing a focused view of the selected data. This interaction helps users drill down into specific business areas, compare performance, identify trends, and investigate operational issues without creating separate reports.

The report supports business users in identifying high-value warehouses, understanding product distribution, evaluating supplier contribution, monitoring inventory health, and making informed decisions for inventory optimization and warehouse management.
