

Mail 3 – Discrepancy Validation & Task Productivity Analytics

4. Validation Issue Analysis :

4.Closed Issues =

```
CALCULATE(
    COUNTROWS('public vw_validation_issue_summary'),
    'public vw_validation_issue_summary'[validation_status] = "Closed"
)
```

4.High Severity Issues =

```
CALCULATE(
    COUNTROWS('public vw_validation_issue_summary'),
    'public vw_validation_issue_summary'[severity] = "High"
)
```

4.Open Issues =

```
CALCULATE(
    COUNTROWS('public vw_validation_issue_summary'),
    'public vw_validation_issue_summary'[validation_status] = "Open"
)
```

3.Category-wise Inventory Mismatch :

Total Discrepancy Value =

```
SUM('public vw_discrepancy_analysis'[discrepancy_value])
```

Total Discrepancy Quantity (Absolute) =

```
ABS(SUM('public vw_discrepancy_analysis'[discrepancy_quantity]))
```

6.Staff Productivity Analytics

Task Efficiency % =

```
DIVIDE(
    SUM('public vw_task_productivity_summary'[completed_tasks]),
    SUM('public vw_task_productivity_summary'[total_tasks]),
    0
)
```

```
Total Delayed Tasks =
SUM('public vw_task_productivity_summary'[delayed_tasks])
```

```
Total Discrepancies =
COUNTROWS('public vw_discrepancy_analysis')
```

```
Total Discrepancy Quantity =
SUM('public vw_discrepancy_analysis'[discrepancy_quantity])
```

8. Discrepancy vs Task Delay Correlation

```
Delayed Tasks =
VAR WH = SELECTEDVALUE('public warehouses'[warehouse_name])
RETURN
CALCULATE(
    SUM('public vw_task_productivity_summary'[delayed_tasks]),
    'public vw_task_productivity_summary'[warehouse_name] = WH
)
```

```
Discrepancy Qty =
VAR WH = SELECTEDVALUE('public warehouses'[warehouse_name])
RETURN
CALCULATE(
    SUM('public vw_discrepancy_analysis'[discrepancy_quantity]),
    'public vw_discrepancy_analysis'[warehouse_name] = WH
)
```

```
Operational Risk =
IF(
    NOT ISINSCOPE('public warehouses'[warehouse_name]),
    BLANK(),
    VAR Delayed = [Delayed Tasks]
    VAR Discrepancy = [Total Discrepancy Quantity (Absolute)]
    VAR Validation = [Validation Issues]
    RETURN
    SWITCH(
        TRUE(),
        Delayed >= 2650 &&
        Discrepancy >= 50000 &&
        Validation >= 5800, "🔴 High Risk",

        Delayed >= 2580 &&
        Discrepancy >= 15000 &&
```

```

Validation >= 5700, "🟡 Medium Risk",

"🟢 Low Risk"
)
)

Validation Issues =
VAR WH = SELECTEDVALUE('public warehouses'[warehouse_name])
RETURN
CALCULATE(
    SUM('public vw_validation_issue_summary'[issue_count]),
    'public vw_validation_issue_summary'[warehouse_name] = WH
)

```

Reporting Insights :

The **Inventory Discrepancy, Validation, and Staff Productivity Dashboard** provides a complete view of inventory accuracy, operational issues, and

warehouse staff performance in a single interactive report.

The dashboard combines inventory discrepancies, validation issues, and staff productivity into one reporting solution, helping management monitor operational performance from different business perspectives. All visuals are connected through **cross-filtering**, allowing users to select any warehouse, discrepancy severity, validation type, issue status, category, or task type. Once a selection is made, every related visual updates automatically, providing a focused analysis of the selected data.

The dashboard enables users to identify high-discrepancy warehouses, understand the root causes of inventory mismatches, monitor validation issues and their resolution status, evaluate staff productivity, and analyze how delayed tasks impact inventory accuracy. By integrating these business areas into one report, management can quickly identify operational risks, prioritize corrective actions, improve inventory accuracy, and enhance warehouse efficiency.

Overall, this interactive reporting solution simplifies operational monitoring, improves data visibility, and supports faster, data-driven decision-making across inventory and warehouse operations.
